Hi:

In previous topics there are some discussions how to print float number in MCUXpresso IDE and SDK.

To try them and summarize the final solution:

1.PRINTF the float number to UART console

set below macro in project configuration->C/C++ build ->setting

```
PRINTF_FLOAT_ENABLE=1
```

such code will work.

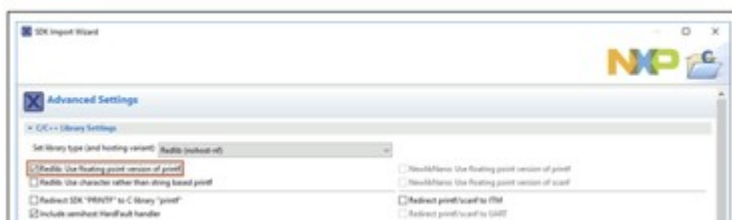

```
float test1 = 0.15;
```

2.Transform float number to string by sprintf() function.

there is one error in SDK user manual, " Ensure Redlib: Use floating point version of printf is selected

" during project creation does not work.

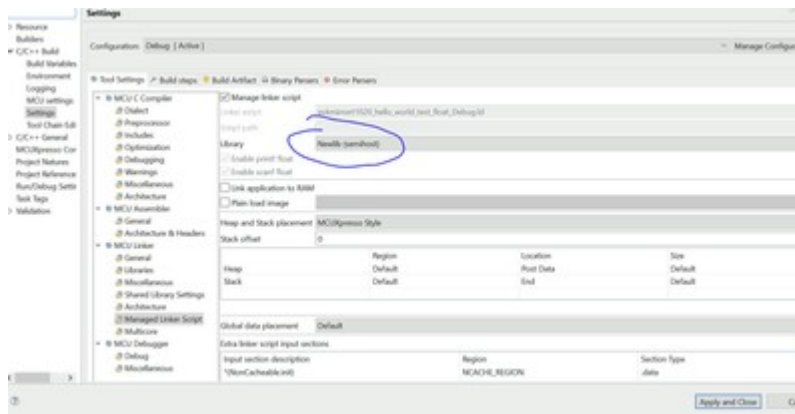

The default C library Redlib doesn't support floating, so it couldn't work with redlib.

The correct solution are:

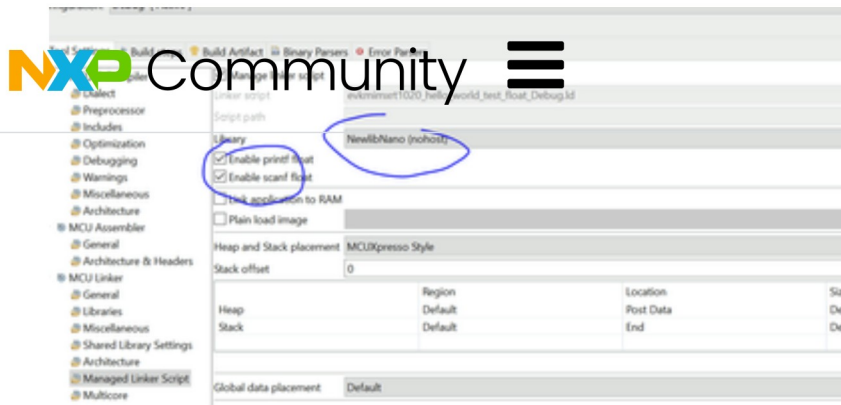

(1)Change link library to NewLib, it's full C library and support float printf.

But notice need include <stdio.h> in related c file, or else sprintf(float) doesn't work as expected.

(2)Change link library to NewLib Nano, it's compact C library , and need click "enable print float" to enable float function, which actually add " -u _printf_float" link symbol.

But notice need include <stdio.h> in related c file, or else sprintf(float) doesn't work as expected.

So the solution surely add flash & RAM consumption in project, but for i.MXRT series it's not problem.

Attach is one example for RT1020 EVK.

Hi [@daweiyou](#)

Thank you so much for your contribution. The information was pretty helpful and it might be helpful for many people.

Thank you again.

Best Regards.
Pablo Avalos.
